

## Three.V Change of Basis

*Linear Algebra*

Jim Hefferon

<http://joshua.smcvt.edu/linearalgebra>

## Changing representations of vectors

## Coordinates vary with the basis

*Example* Consider this vector  $\vec{v} \in \mathbb{R}^3$  and bases for the space.

$$\vec{v} = \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix} \quad \mathcal{E}_3 = \left\langle \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} \right\rangle \quad B = \left\langle \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 0 \\ 1 \end{pmatrix} \right\rangle$$

With respect to the different bases, the coordinates of  $\vec{v}$  are different.

$$\text{Rep}_{\mathcal{E}_3}(\vec{v}) = \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix} \quad \text{Rep}_B(\vec{v}) = \begin{pmatrix} 0 \\ 2 \\ 1 \end{pmatrix}$$

Here we will see how to convert between the two representations: given two bases for a space we will develop a formula that converts the representation of a vector with respect to the first basis to the representation with respect to the second.

## Change of basis matrix

Think of translating from  $\text{Rep}_B(\vec{v})$  to  $\text{Rep}_D(\vec{v})$  as holding the vector constant. This is the arrow diagram.

$$\begin{array}{c} V_{\text{wrt } B} \\ \text{id} \downarrow \\ V_{\text{wrt } D} \end{array}$$

(This diagram is vertical to fit with the ones in the next subsection.)

## Change of basis matrix

Think of translating from  $\text{Rep}_B(\vec{v})$  to  $\text{Rep}_D(\vec{v})$  as holding the vector constant. This is the arrow diagram.

$$\begin{array}{c} V_{\text{wrt } B} \\ \text{id} \downarrow \\ V_{\text{wrt } D} \end{array}$$

(This diagram is vertical to fit with the ones in the next subsection.)

1.1 *Definition* The *change of basis matrix* for bases  $B, D \subset V$  is the representation of the identity map  $\text{id}: V \rightarrow V$  with respect to those bases.

$$\text{Rep}_{B,D}(\text{id}) = \begin{pmatrix} \vdots & & \vdots \\ \text{Rep}_D(\vec{\beta}_1) & \cdots & \text{Rep}_D(\vec{\beta}_n) \\ \vdots & & \vdots \end{pmatrix}$$

This result supports the definition.

- 1.3 *Lemma* Left-multiplication by the change of basis matrix for  $B, D$  converts a representation with respect to  $B$  to one with respect to  $D$ . Conversely, if left-multiplication by a matrix changes bases  $M \cdot \text{Rep}_B(\vec{v}) = \text{Rep}_D(\vec{v})$  then  $M$  is a change of basis matrix.

*Proof* The first sentence holds because matrix-vector multiplication represents a map application and so  $\text{Rep}_{B,D}(\text{id}) \cdot \text{Rep}_B(\vec{v}) = \text{Rep}_D(\text{id}(\vec{v})) = \text{Rep}_D(\vec{v})$  for each  $\vec{v}$ . For the second sentence, with respect to  $B, D$  the matrix  $M$  represents a linear map whose action is to map each vector to itself, and is therefore the identity map. QED

*Example* Two bases for  $\mathcal{P}_2$  are  $B = \langle 1, 1 + x, 1 + x + x^2 \rangle$  and  $D = \langle x^2 - 1, x, x^2 + 1 \rangle$ . Compute  $\text{Rep}_{B,D}(\text{id})$  in the same way that we compute the representation of any function: find  $\text{Rep}_D(\text{id}(1))$ ,  $\text{Rep}_D(\text{id}(1 + x))$ , and  $\text{Rep}_D(\text{id}(1 + x + x^2))$ .

$$\text{Rep}_D(1) = \begin{pmatrix} -1/2 \\ 0 \\ 1/2 \end{pmatrix} \quad \text{Rep}_D(1+x) = \begin{pmatrix} -1/2 \\ 1 \\ 1/2 \end{pmatrix} \quad \text{Rep}_D(1+x+x^2) = \begin{pmatrix} 0 \\ 1 \\ 1 \end{pmatrix}$$

We put them together into the change of basis matrix.

$$\text{Rep}_{B,D}(\text{id}) = \begin{pmatrix} -1/2 & -1/2 & 0 \\ 0 & 1 & 1 \\ 1/2 & 1/2 & 1 \end{pmatrix}$$

For an example consider  $\vec{v} = 2 - x + 3x^2$ .

$$\text{Rep}_B(\vec{v}) = \begin{pmatrix} 3 \\ -4 \\ 3 \end{pmatrix} \quad \text{Rep}_D(\vec{v}) = \begin{pmatrix} 1/2 \\ -1 \\ 5/2 \end{pmatrix}$$

The change of basis matrix does the conversion.

$$\begin{pmatrix} -1/2 & -1/2 & 0 \\ 0 & 1 & 1 \\ 1/2 & 1/2 & 1 \end{pmatrix} \begin{pmatrix} 3 \\ -4 \\ 3 \end{pmatrix} = \begin{pmatrix} 1/2 \\ -1 \\ 5/2 \end{pmatrix}$$

1.5 *Lemma* A matrix changes bases if and only if it is nonsingular.

*Proof* For the ‘only if’ direction, if left-multiplication by a matrix changes bases then the matrix represents an invertible function, simply because we can invert the function by changing the bases back. Because it represents a function that is invertible, the matrix itself is invertible, and so is nonsingular.

1.5 *Lemma* A matrix changes bases if and only if it is nonsingular.

*Proof* For the ‘only if’ direction, if left-multiplication by a matrix changes bases then the matrix represents an invertible function, simply because we can invert the function by changing the bases back. Because it represents a function that is invertible, the matrix itself is invertible, and so is nonsingular.

For ‘if’ we will show that any nonsingular matrix  $M$  performs a change of basis operation from any given starting basis  $B$  (having  $n$  vectors, where the matrix is  $n \times n$ ) to some ending basis.

If the matrix is the identity  $I$  then the statement is obvious. Otherwise because the matrix is nonsingular Corollary IV.3.23 says there are elementary reduction matrices such that  $R_r \cdots R_1 \cdot M = I$  with  $r \geq 1$ . Elementary matrices are invertible and their inverses are also elementary so multiplying both sides of that equation from the left by  $R_r^{-1}$ , then by  $R_{r-1}^{-1}$ , etc., gives  $M$  as a product of elementary matrices  $M = R_1^{-1} \cdots R_r^{-1}$ .

We will be done if we show that elementary matrices change a given basis to another basis, since then  $R_r^{-1}$  changes  $B$  to some other basis  $B_r$  and  $R_{r-1}^{-1}$  changes  $B_r$  to some  $B_{r-1}$ , etc. We will cover the three types of elementary matrices separately; recall the notation for the three.

$$M_i(k) \begin{pmatrix} c_1 \\ \vdots \\ c_i \\ \vdots \\ c_n \end{pmatrix} = \begin{pmatrix} c_1 \\ \vdots \\ kc_i \\ \vdots \\ c_n \end{pmatrix} \quad P_{i,j} \begin{pmatrix} c_1 \\ \vdots \\ c_i \\ \vdots \\ c_j \\ \vdots \\ c_n \end{pmatrix} = \begin{pmatrix} c_1 \\ \vdots \\ c_j \\ \vdots \\ c_i \\ \vdots \\ c_n \end{pmatrix} \quad C_{i,j}(k) \begin{pmatrix} c_1 \\ \vdots \\ c_i \\ \vdots \\ c_j \\ \vdots \\ c_n \end{pmatrix} = \begin{pmatrix} c_1 \\ \vdots \\ c_i \\ \vdots \\ kc_i + c_j \\ \vdots \\ c_n \end{pmatrix}$$

Applying a row-multiplication matrix  $M_i(k)$  changes a representation with respect to  $\langle \vec{\beta}_1, \dots, \vec{\beta}_i, \dots, \vec{\beta}_n \rangle$  to one with respect to  $\langle \vec{\beta}_1, \dots, (1/k)\vec{\beta}_i, \dots, \vec{\beta}_n \rangle$ .

$$\vec{v} = c_1 \cdot \vec{\beta}_1 + \dots + c_i \cdot \vec{\beta}_i + \dots + c_n \cdot \vec{\beta}_n$$

$$\mapsto c_1 \cdot \vec{\beta}_1 + \dots + kc_i \cdot (1/k)\vec{\beta}_i + \dots + c_n \cdot \vec{\beta}_n = \vec{v}$$

The second one is a basis because the first is a basis and because of the  $k \neq 0$  restriction in the definition of a row-multiplication matrix.

Applying a row-multiplication matrix  $M_i(k)$  changes a representation with respect to  $\langle \vec{\beta}_1, \dots, \vec{\beta}_i, \dots, \vec{\beta}_n \rangle$  to one with respect to  $\langle \vec{\beta}_1, \dots, (1/k)\vec{\beta}_i, \dots, \vec{\beta}_n \rangle$ .

$$\begin{aligned}\vec{v} &= c_1 \cdot \vec{\beta}_1 + \dots + c_i \cdot \vec{\beta}_i + \dots + c_n \cdot \vec{\beta}_n \\ &\mapsto c_1 \cdot \vec{\beta}_1 + \dots + kc_i \cdot (1/k)\vec{\beta}_i + \dots + c_n \cdot \vec{\beta}_n = \vec{v}\end{aligned}$$

The second one is a basis because the first is a basis and because of the  $k \neq 0$  restriction in the definition of a row-multiplication matrix.

Similarly, left-multiplication by a row-swap matrix  $P_{i,j}$  changes a representation with respect to the basis  $\langle \vec{\beta}_1, \dots, \vec{\beta}_i, \dots, \vec{\beta}_j, \dots, \vec{\beta}_n \rangle$  into one with respect to this basis  $\langle \vec{\beta}_1, \dots, \vec{\beta}_j, \dots, \vec{\beta}_i, \dots, \vec{\beta}_n \rangle$ .

$$\begin{aligned}\vec{v} &= c_1 \cdot \vec{\beta}_1 + \dots + c_i \cdot \vec{\beta}_i + \dots + c_j \vec{\beta}_j + \dots + c_n \cdot \vec{\beta}_n \\ &\mapsto c_1 \cdot \vec{\beta}_1 + \dots + c_j \cdot \vec{\beta}_j + \dots + c_i \cdot \vec{\beta}_i + \dots + c_n \cdot \vec{\beta}_n = \vec{v}\end{aligned}$$

And, a representation with respect to  $\langle \vec{\beta}_1, \dots, \vec{\beta}_i, \dots, \vec{\beta}_j, \dots, \vec{\beta}_n \rangle$  changes via left-multiplication by a row-combination matrix  $C_{i,j}(k)$  into a representation with respect to  $\langle \vec{\beta}_1, \dots, \vec{\beta}_i - k\vec{\beta}_j, \dots, \vec{\beta}_j, \dots, \vec{\beta}_n \rangle$

$$\begin{aligned}\vec{v} &= c_1 \cdot \vec{\beta}_1 + \dots + c_i \cdot \vec{\beta}_i + c_j \vec{\beta}_j + \dots + c_n \cdot \vec{\beta}_n \\ \mapsto c_1 \cdot \vec{\beta}_1 + \dots + c_i \cdot (\vec{\beta}_i - k\vec{\beta}_j) + \dots + (kc_i + c_j) \cdot \vec{\beta}_j + \dots + c_n \cdot \vec{\beta}_n &= \vec{v}\end{aligned}$$

(the definition of  $C_{i,j}(k)$  specifies that  $i \neq j$  and  $k \neq 0$ ). QED

1.6 *Corollary*    A matrix is nonsingular if and only if it represents the identity map with respect to some pair of bases.

Changing map representations

The natural next step for us is to see how to convert  $\text{Rep}_{B,D}(h)$  to  $\text{Rep}_{\hat{B},\hat{D}}(h)$ . Here is the arrow diagram.

$$\begin{array}{ccc} V_{wrt\ B} & \xrightarrow[\quad H \quad]{} & W_{wrt\ D} \\ \text{id} \downarrow & & \text{id} \downarrow \\ V_{wrt\ \hat{B}} & \xrightarrow[\quad \hat{H} \quad]{} & W_{wrt\ \hat{D}} \end{array}$$

To move from the lower-left to the lower-right we can either go straight over, or else up to  $V_B$  then over to  $W_D$  and then down. So we can calculate  $\hat{H} = \text{Rep}_{\hat{B},\hat{D}}(h)$  either by directly using  $\hat{B}$  and  $\hat{D}$ , or else by first changing bases with  $\text{Rep}_{\hat{B},B}(\text{id})$  then multiplying by  $H = \text{Rep}_{B,D}(h)$  and then changing bases with  $\text{Rep}_{D,\hat{D}}(\text{id})$ .

$$\hat{H} = \text{Rep}_{D,\hat{D}}(\text{id}) \cdot H \cdot \text{Rep}_{\hat{B},B}(\text{id}) \quad (*)$$

*Example* Consider the derivative map  $d/dx: \mathcal{P}_2 \rightarrow \mathcal{P}_2$ , and consider also these two pairs of bases

$B = \langle 1, 1+x, 1+x+x^2 \rangle, D = \langle 1+x^2, x, 1-x^2 \rangle$  and  $\hat{B} = \langle 1, x, x^2 \rangle, \hat{D} = \langle 1+x, x+x^2, 1+x^2 \rangle$ .

We can find  $H$  and  $\hat{H}$  using the methods we have already seen.

$$\text{Rep}_{B,D}(d/dx) = \begin{pmatrix} 0 & 1/2 & 1/2 \\ 0 & 0 & 1 \\ 0 & 1/2 & 1/2 \end{pmatrix} \quad \text{Rep}_{\hat{B},\hat{D}}(d/dx) = \begin{pmatrix} 0 & 1/2 & 1/2 \\ 0 & -1/2 & 1/2 \\ 0 & 1/2 & -1/2 \end{pmatrix}$$

To do the conversion we find these.

$$\text{Rep}_{\hat{B},B}(\text{id}) = \begin{pmatrix} 1 & -1 & 0 \\ 0 & 1 & -1 \\ 0 & 0 & 1 \end{pmatrix} \quad \text{Rep}_{D,\hat{D}}(\text{id}) = \begin{pmatrix} 0 & 1/2 & 1 \\ 0 & 1/2 & -1 \\ 1 & -1/2 & 0 \end{pmatrix}$$

Equation (\*) says that this equals  $\text{Rep}_{\hat{B},\hat{D}}(d/dx)$ .

$$\begin{pmatrix} 0 & 1/2 & 1 \\ 0 & 1/2 & -1 \\ 1 & -1/2 & 0 \end{pmatrix} \begin{pmatrix} 0 & 1/2 & 1/2 \\ 0 & 0 & 1 \\ 0 & 1/2 & 1/2 \end{pmatrix} \begin{pmatrix} 1 & -1 & 0 \\ 0 & 1 & -1 \\ 0 & 0 & 1 \end{pmatrix}$$

2.3 *Definition* Same-sized matrices  $H$  and  $\hat{H}$  are *matrix equivalent* if there are nonsingular matrices  $P$  and  $Q$  such that  $\hat{H} = PHQ$ .

- 2.3 *Definition* Same-sized matrices  $H$  and  $\hat{H}$  are *matrix equivalent* if there are nonsingular matrices  $P$  and  $Q$  such that  $\hat{H} = PHQ$ .
- 2.4 *Corollary* Matrix equivalent matrices represent the same map, with respect to appropriate pairs of bases.

2.3 *Definition* Same-sized matrices  $H$  and  $\hat{H}$  are *matrix equivalent* if there are nonsingular matrices  $P$  and  $Q$  such that  $\hat{H} = PHQ$ .

2.4 *Corollary* Matrix equivalent matrices represent the same map, with respect to appropriate pairs of bases.

Exercise 19 checks that matrix equivalence is an equivalence relation. Thus it partitions the set of matrices into matrix equivalence classes.

## Canonical form for matrix equivalence

2.6 *Theorem* Any  $m \times n$  matrix of rank  $k$  is matrix equivalent to the  $m \times n$  matrix that is all zeros except that the first  $k$  diagonal entries are ones.

$$\begin{pmatrix} 1 & 0 & \dots & 0 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 & 0 & \dots & 0 \\ & \vdots & & & & & \\ 0 & 0 & \dots & 1 & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 & 0 & \dots & 0 \\ & \vdots & & & & & \\ 0 & 0 & \dots & 0 & 0 & \dots & 0 \end{pmatrix}$$

## Canonical form for matrix equivalence

2.6 *Theorem* Any  $m \times n$  matrix of rank  $k$  is matrix equivalent to the  $m \times n$  matrix that is all zeros except that the first  $k$  diagonal entries are ones.

$$\begin{pmatrix} 1 & 0 & \dots & 0 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 & 0 & \dots & 0 \\ & \vdots & & & & & \\ 0 & 0 & \dots & 1 & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 & 0 & \dots & 0 \\ & \vdots & & & & & \\ 0 & 0 & \dots & 0 & 0 & \dots & 0 \end{pmatrix}$$

This is a *block partial-identity* form.

$$\left( \begin{array}{c|c} I & Z \\ \hline Z & Z \end{array} \right)$$

*Proof* Any  $m \times n$  matrix of rank  $k$  is matrix equivalent to the  $m \times n$  matrix that is all zeros except that the first  $k$  diagonal entries are ones.

$$\begin{pmatrix} 1 & 0 & \dots & 0 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 & 0 & \dots & 0 \\ & \vdots & & & & & \\ 0 & 0 & \dots & 1 & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 & 0 & \dots & 0 \\ & \vdots & & & & & \\ 0 & 0 & \dots & 0 & 0 & \dots & 0 \end{pmatrix}$$

QED

## Matrix equivalence is characterized by rank

- 2.8 *Corollary*    Matrix equivalence classes are characterized by rank:  
two same-sized matrices are matrix equivalent if and only if they have the same rank.

## Matrix equivalence is characterized by rank

2.8 *Corollary*    Matrix equivalence classes are characterized by rank: two same-sized matrices are matrix equivalent if and only if they have the same rank.

*Proof*    Two same-sized matrices with the same rank are equivalent to the same block partial-identity matrix. QED

## Matrix equivalence is characterized by rank

2.8 *Corollary* Matrix equivalence classes are characterized by rank: two same-sized matrices are matrix equivalent if and only if they have the same rank.

*Proof* Two same-sized matrices with the same rank are equivalent to the same block partial-identity matrix. QED

*Example* These two matrices are not matrix equivalent because Gauss's Method shows that the first has rank 3 while the second has rank 2.

$$\begin{pmatrix} 2 & 3 & 0 & -1 \\ 2 & 2 & 1 & 1 \\ 3 & 1 & 0 & 3 \end{pmatrix} \quad \begin{pmatrix} 1 & 5 & 1 & 4 \\ 2 & 0 & 5 & 1 \\ 3 & -5 & 9 & -2 \end{pmatrix}$$

*Example* These two are matrix equivalent.

$$\begin{pmatrix} 1 & 1 & 1 & 1 & 1 \\ -1 & -1 & -1 & -1 & -1 \\ 2 & 0 & 0 & 3 & 0 \end{pmatrix} \quad \begin{pmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{pmatrix}$$
